Trends in the IOD in the past decades

Wenju Cai, Tim Cowan, Arnold Sullivan, and Peter van Rensch

Outline and conclusions

- There is an increase in the frequency of positive Indian Ocean Dipole events, with a consistent mean state trend
- 20th century climate experiments suggest that climate change is contributing to the increase.
- Although factors contributing to the mean state are less difficult to identify, the response of the associated feedback processes is not clear

(nonlinear dynamical feedback, SST-cloud-radiation feedback, thermocline-SST feedback, winds to SST, and thermocline to winds).

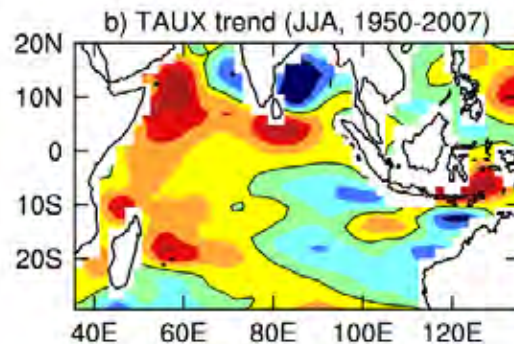

Unprecedented high number of pIODs, low number of nIODs

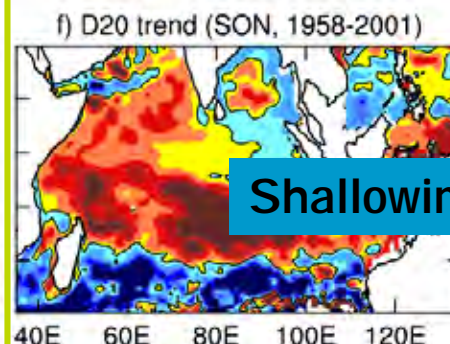

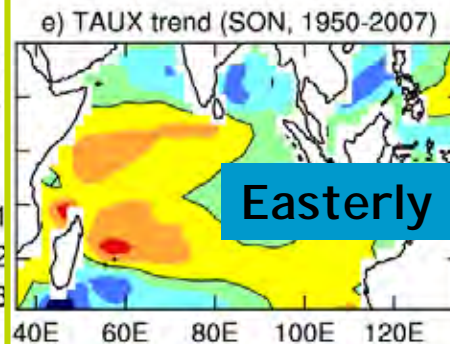

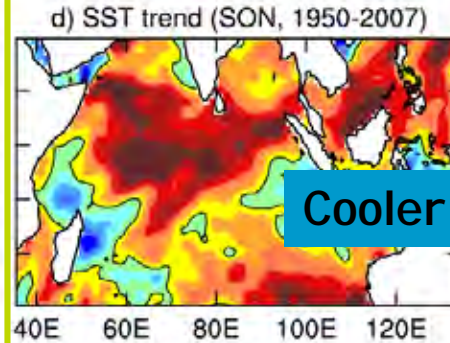

Cowan's talk this afternoon

Mean circulation conditions since 1950s

JJA

SON

Consistent with pIOD-like change

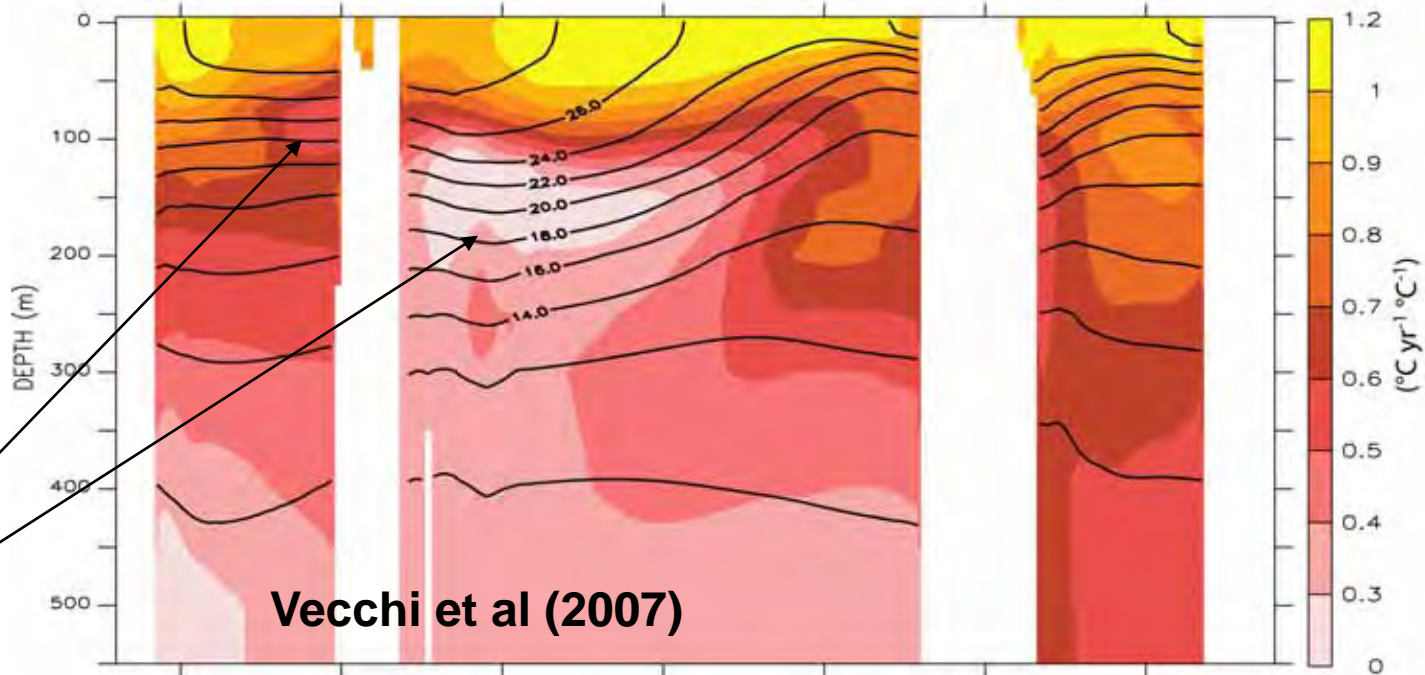

Equatorial Pacific thermocline flattens and shoals.

Increased thermal stratification.

Minimum in warming

Scenario A1B (720 ppm CO₂ Stabilization) - 2001-2100
19-Model Ensemble-mean 100-year Thermocline Depth Trend (Normalized by Global SST Trend)

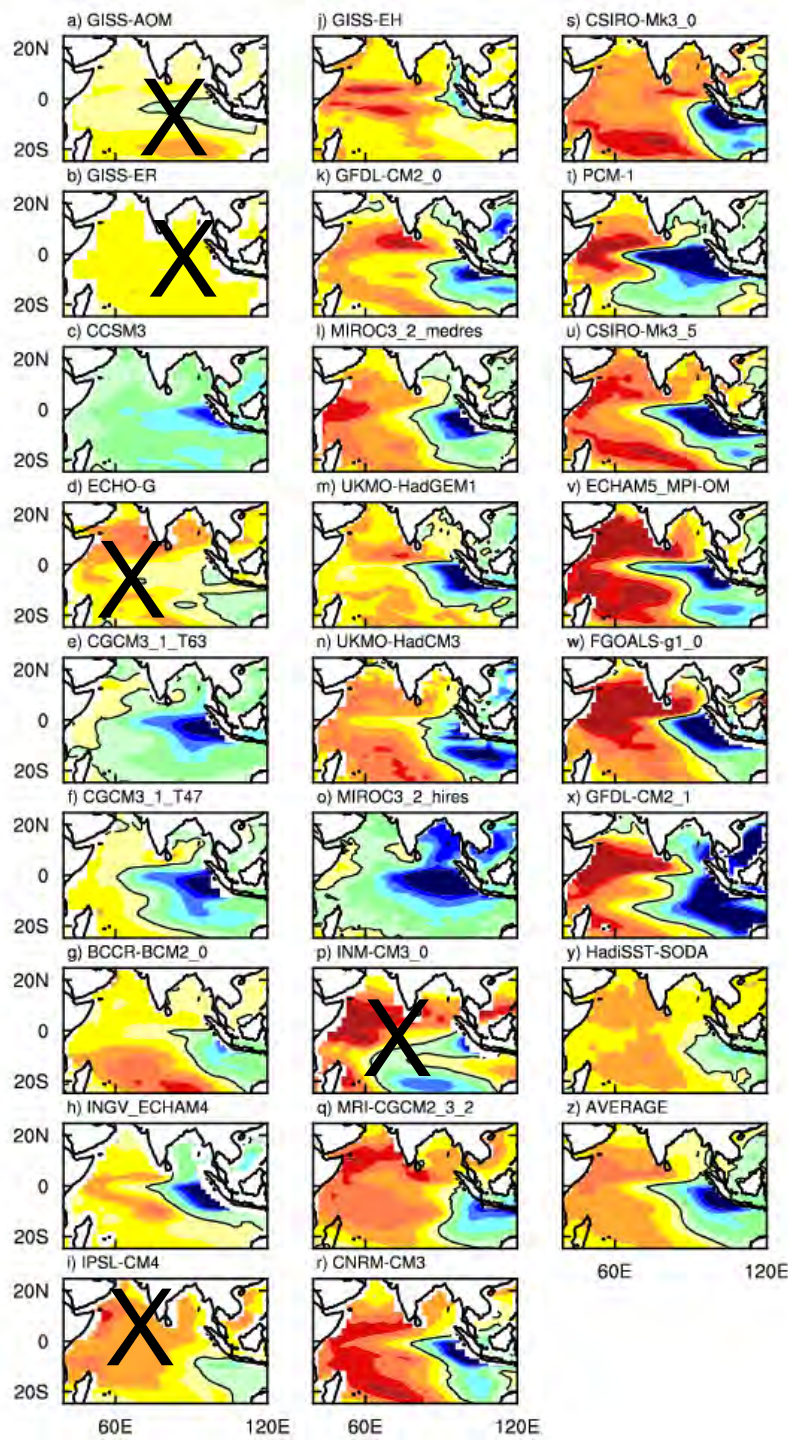

Vecchi et al (2007)

19-Model Ensemble-mean 100-year Equatorial Temperature Trend (Normalized by Global SST Trend)

But is the observed attributable to climate change? IPCC model selections (20th century experiments)

- **One experiment from each model, two versions of data since 1950**
 - **Detrended data to remove climate change signal**
 - **Raw model outputs**

SON IOD patterns (detrended SST EOF)

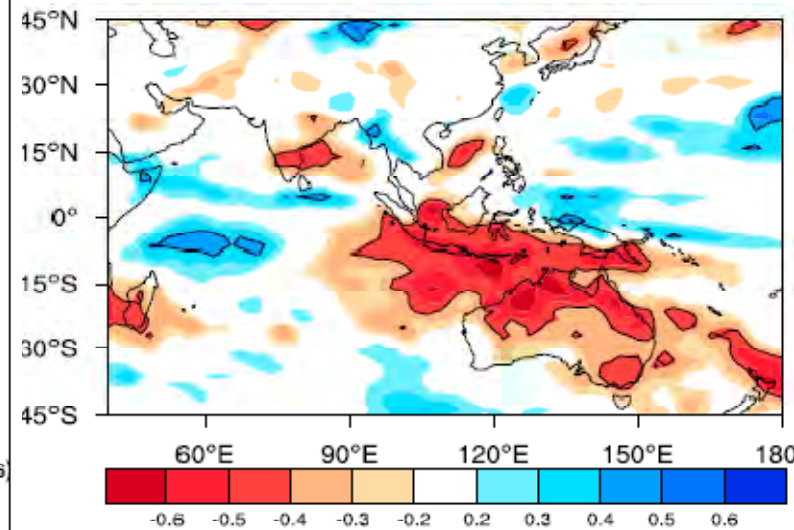

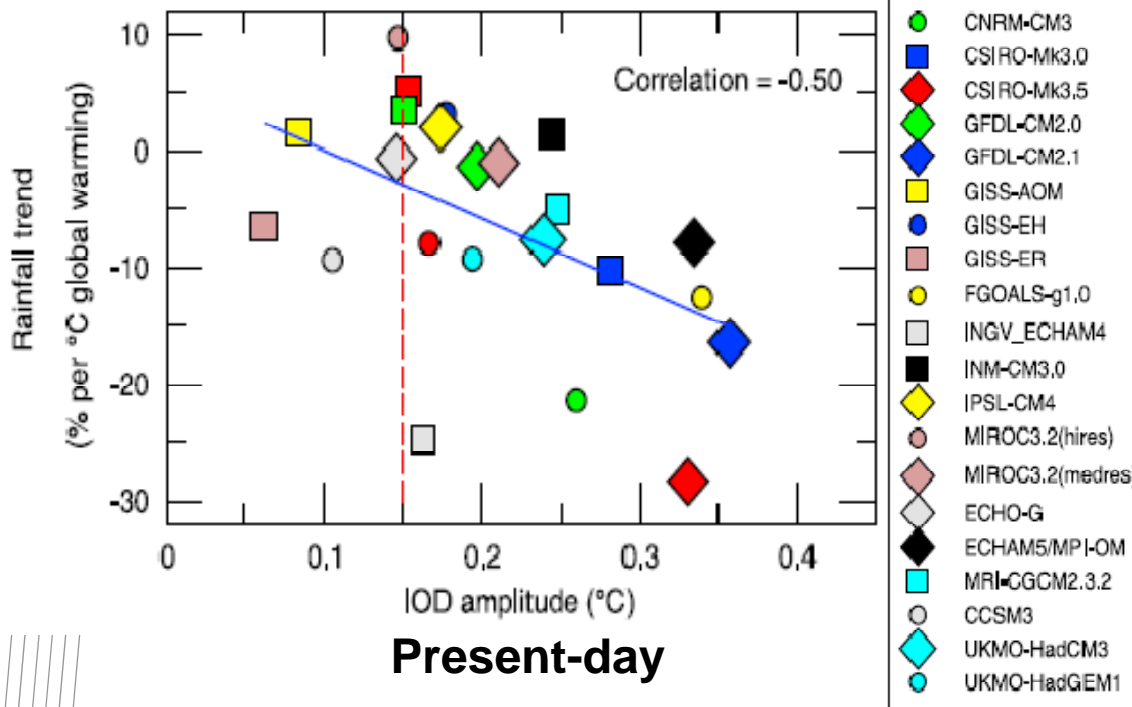

Observed

All-model average

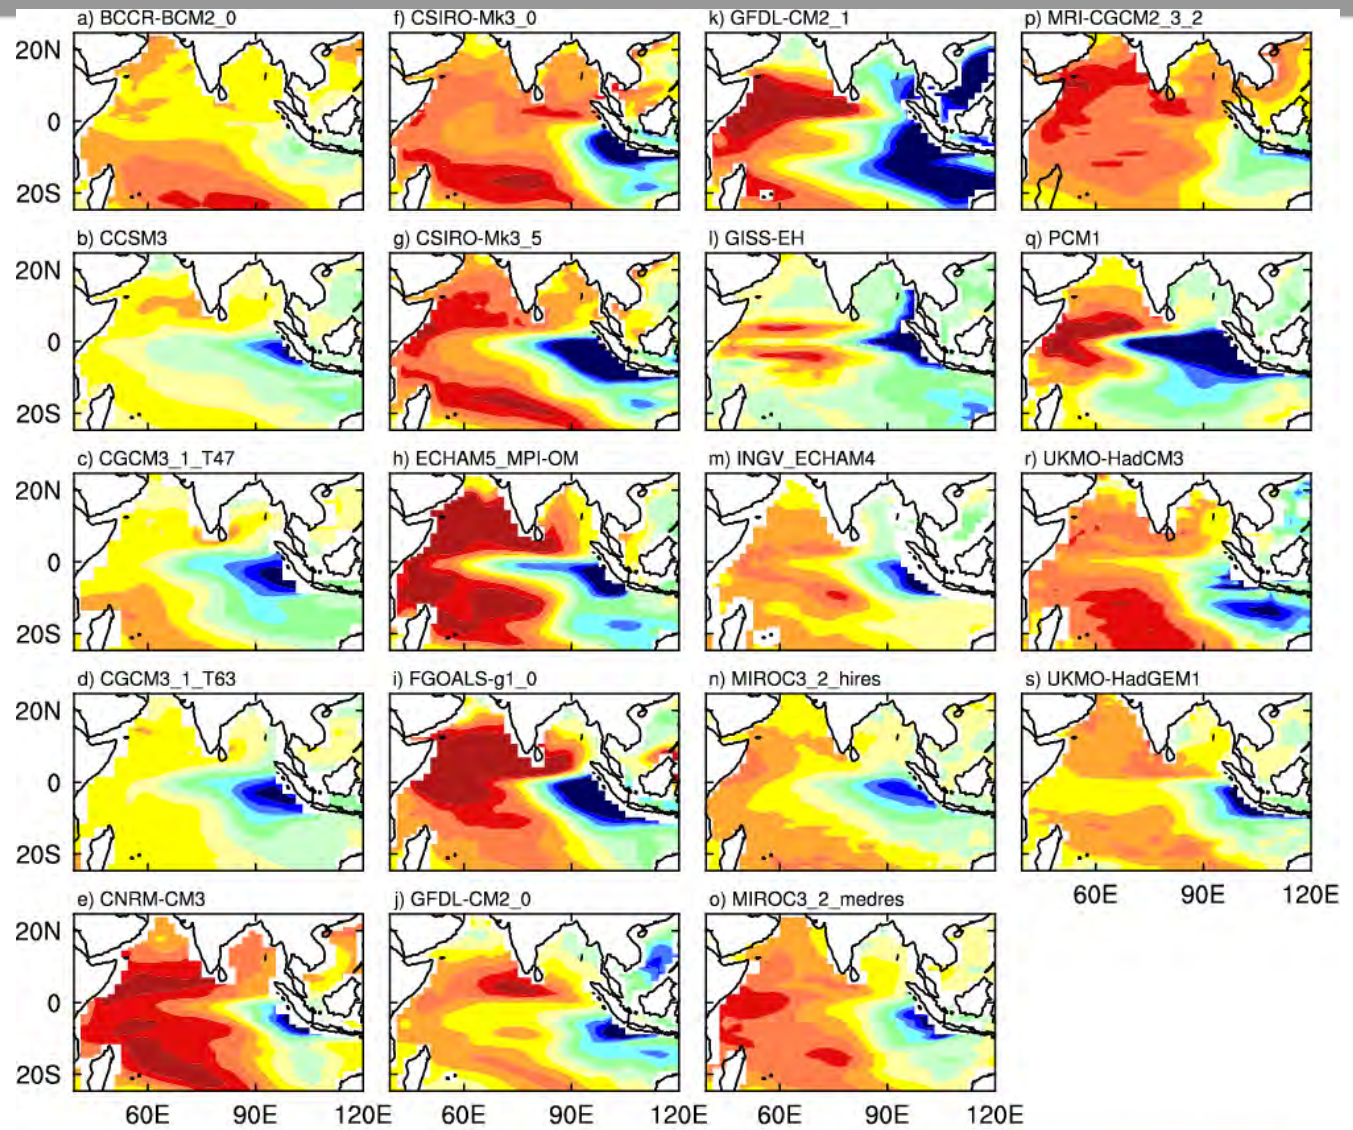

Is the IOD amplitude relevant to climate projection?

Present-day IOD amplitude & rainfall trend over the IODE region

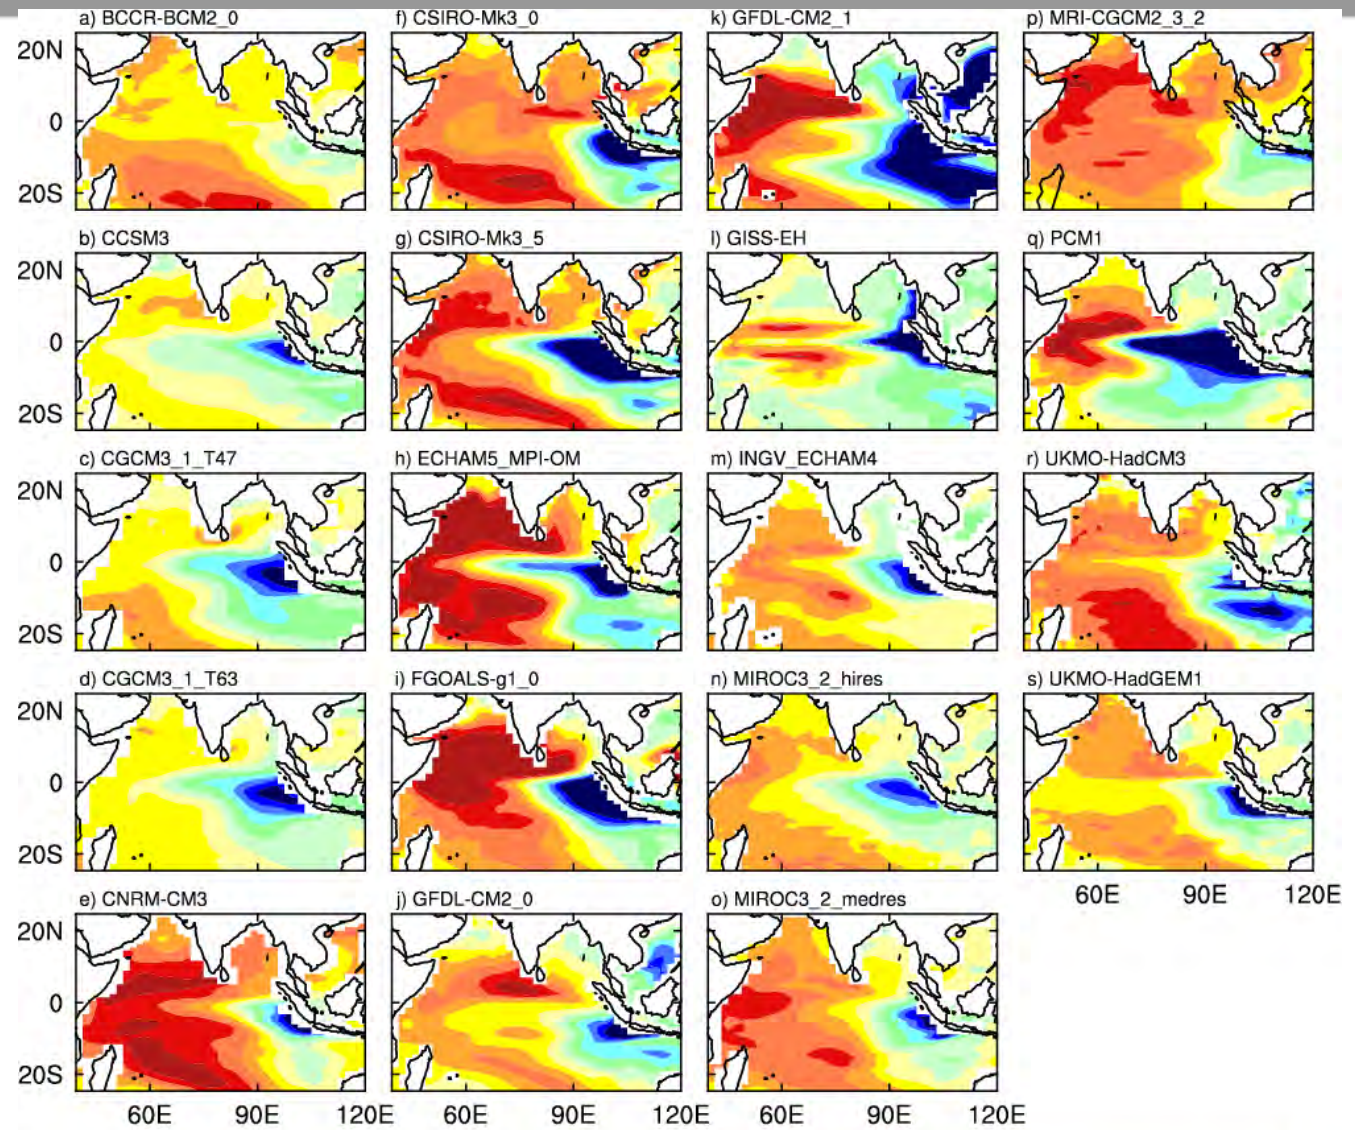

Cai et al. 2011, GRL

The IOD pattern in 19 models using data

The IOD pattern in 19 models using **detrended** data

EOF time series using outputs with trends

A trend of
0.75 Std. Dev.

Global warming and IOD frequencies

19 IPCC AR4 Climate Models, 50x19 = 950 years

	pIOD (0.75 std. dev.)	
With Climate Change	224	
Without Climate Change	192	
	Two-consecutive pIOD	Three-consecutive pIOD
With Climate Change	42	8
Without Climate Change	32	2

Cai et al. 2009b, GRL

It turns out the increase in IOD frequency is NOT due to

- A trend in El Nino
- The southern annular mode (Sullivan's talk this afternoon)

Land-sea T contrast

- BCCR-BCM2.0
- CCSM3
- CGCM3.1(T47)
- CGCM3.1(T63)
- CNRM-CM3
- CSIRO-Mk3.0
- ◆ CSIRO-Mk3.5
- ◆ ECHAM5/MPI-OM
- FGOALS-g1.0
- ◆ GFDL-CM2.0
- ◆ GFDL-CM2.1
- GISS-EH
- INGV_ECHAM4
- MIROC3.2(hires)
- ◆ MIROC3.2(medres)
- MRI-CGCM2.3.2
- PCM
- ◆ UKMO-HadCM3
- UKMO-HadGEM1

However, we don't know how those feedback processes are changing?

These are associated with an amplitude skewness of the IODE: negative SST anomalies grow to a large amplitude than positive SST

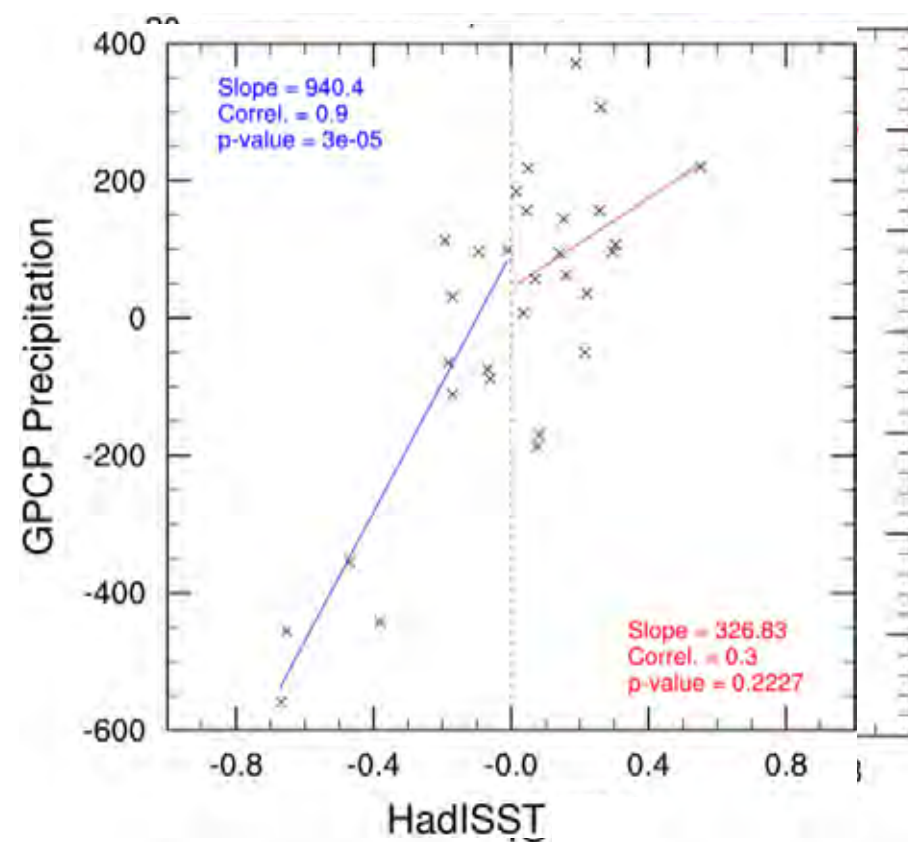

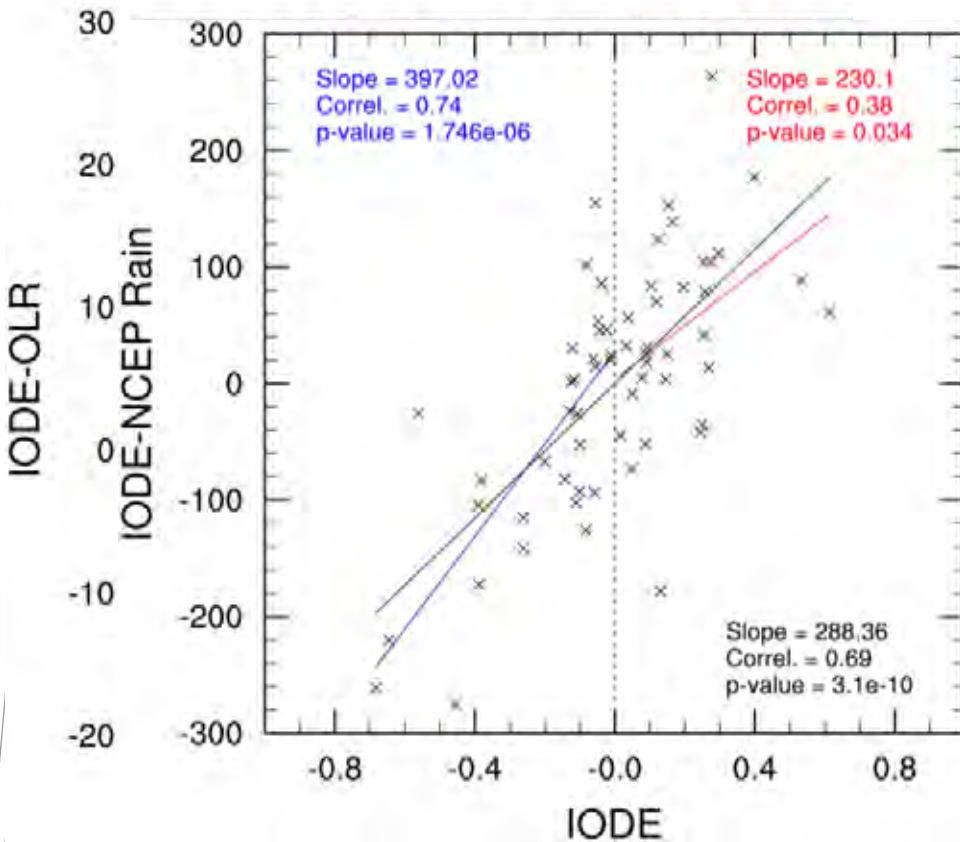

From Hong et al. 2008

(1) Nonlinear dynamical feedback (could be positive, could be negative)

$$NAT = \left[-\dot{U} \frac{\partial \dot{T}}{\partial x} \right] + \left[-\dot{W} \frac{\partial \dot{T}}{\partial z} \right]$$

plOD	—	—	—	—	—	—	—
nIOD	—	—	+	+	—	+	+

(2) SST-cloud-radiation feedback (damping)

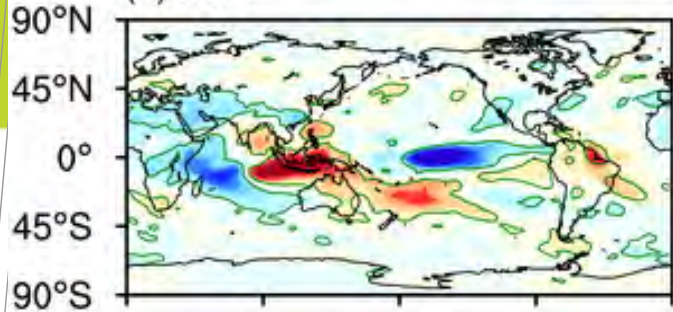

Outgoing longwave radiation

200hPa geopotential height

Precipitation

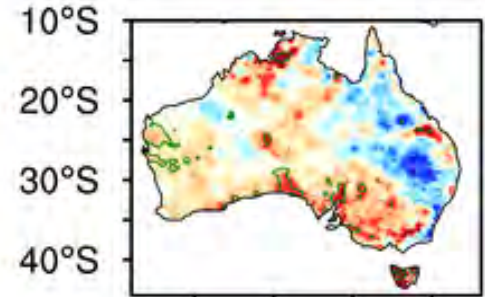

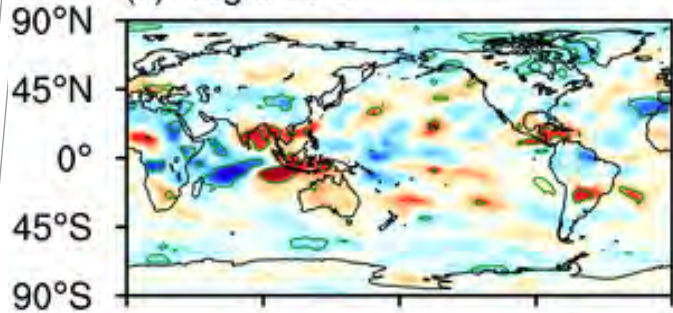

(a) DMI

(b) Positive DMI

(c) Negative DMI

0° 90°E 180° 90°W 0°

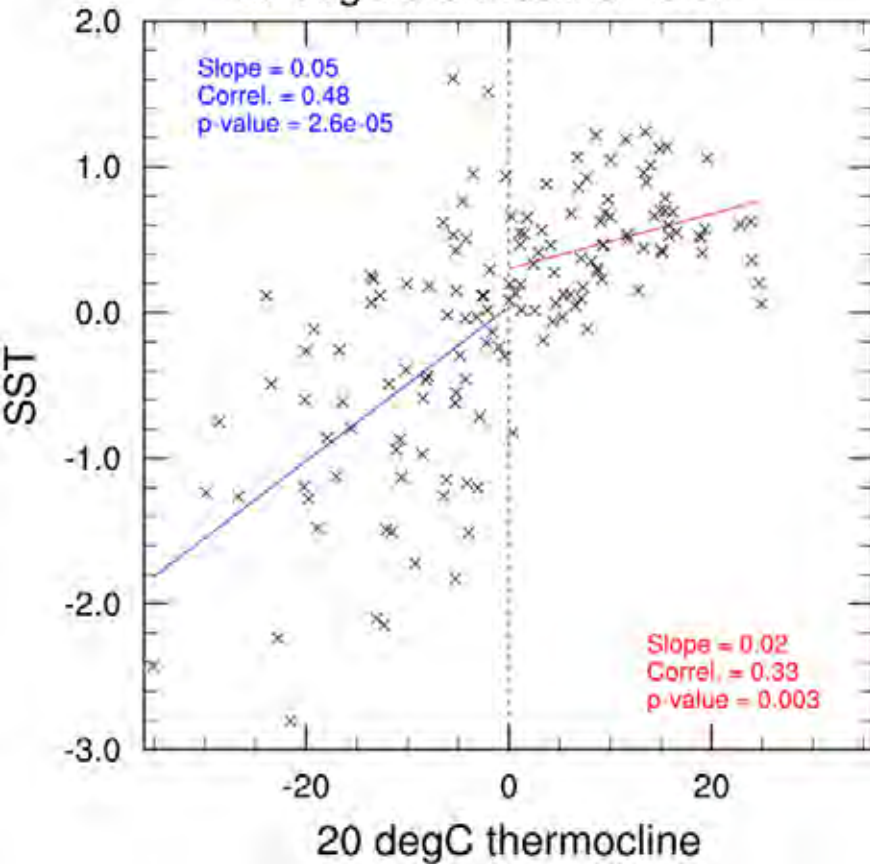

0° 90°E 180° 90°W 0°

120°E 140°E

(3) Thermocline -- SST feedback (positive feedback)

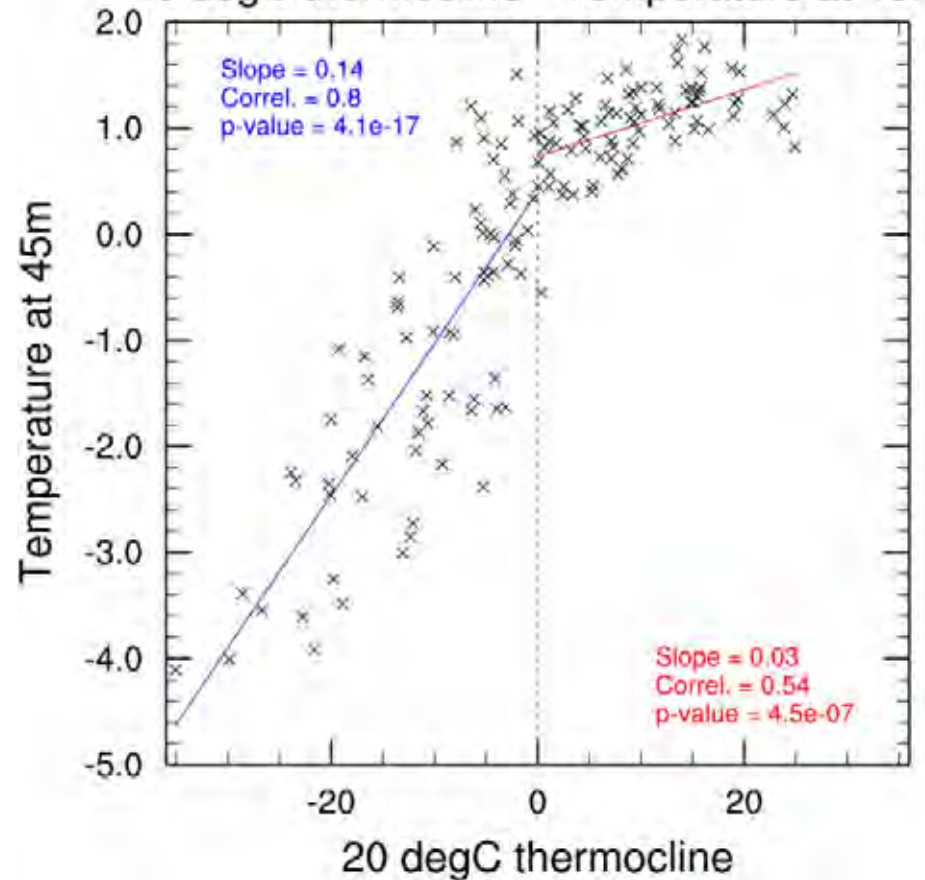

GFDL CM2.1 SON all months
20 degC thermocline - SST

A ratio of 2.5: 1

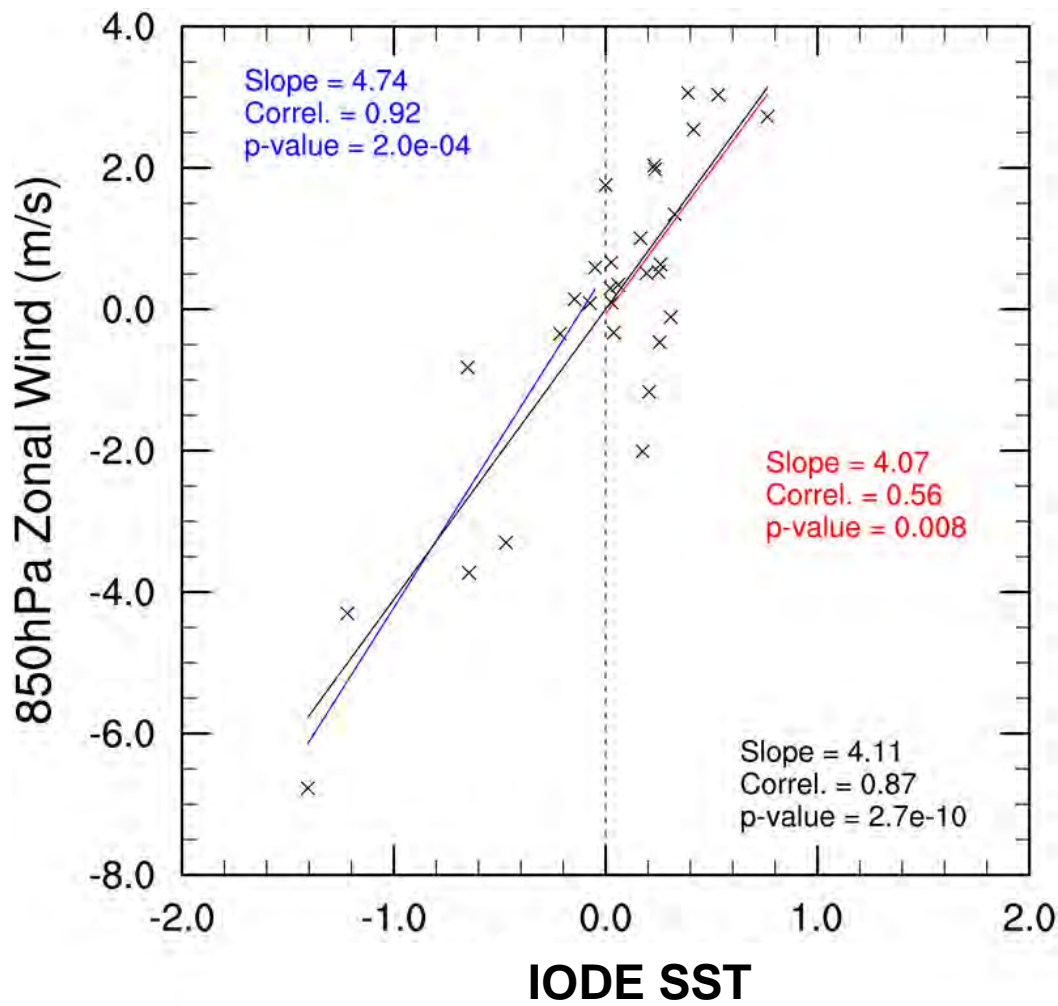

Zheng et al. 2010

GFDL CM2.1 SON all months
20 degC thermocline - Temperature at 45m

A ratio of 3.6: 1

(4) Zonal winds to IODE SST (positive feedback)

(5) Sensitivity of thermocline to winds (positive feedback)

Because the stratification is changing, the sensitivity may change too.

Outline and conclusions

- There is an increase in the frequency of positive Indian Ocean Dipole events, with a consistent mean state trend
- 20th century climate experiments suggest that climate change is contributing to the increase.
- Although factors contributing to the mean state are less difficult to identify, the response of the associated feedback processes is not clear

(nonlinear dynamical feedback, SST-cloud-radiation feedback, thermocline-SST feedback, winds to SST, and thermocline to winds).
